October 11, 2016, update for SharePoint Server 2013 (KB3118355)

- Updates Norwegian_Nynorsk proofing tools.
- Adds a new feature to allow recall to be excluded from the link update group of search indexes which may contain unrelated content based on your queries.
- Fixes the following issues:
 - The **Options** dialog box appears after seconds of delay with Czech keyboard layout and proofing tools.
 - Search results aren't ranked correctly for certain queries and result sets.
 - Fixes an Alternative Access Mapping (AAM) performance issue in which search from SharePoint sites that are AMM mapped times out.
 - Enables query logging to record original query text.
 - Improves text extraction of single byte character sets when it's used in composite fonts in PDF files.

- Computers that are running SQL Server are affected by the Task List synchronization jobs if the jobs freeze, this causes the SharePoint platform to be inaccessible. Corporate Intranet availability is affected. Access to all files and folders that are shared by teams and partners are unavailable.

Note If the Task List job is disabled, no shared team or project tasks can be synchronized to Outlook 2013.

- You cannot get auto-generated query suggestions for search pages when a custom result source is used in the query.
- Followed Count Web Part can't be displayed because of null reference exception.
- Crawl information isn't displayed for lists on sub sites.
- Navigation settings to hide or unhide items don't work correctly.
- When a site is on hold, the attachments of list items on the site aren't preserved. The update changes the behavior and preserves attachments of list items on a site that's on hold when the attachments or the items are deleted. The attachments are preserved in a preservation hold library. To enable this feature for an existing site that's on hold, upgrade should be executed (by using psConfig or Configuration wizard).
- Enables extraction of OLE properties from a third-party IFilter.

[October 11, 2016, update for SharePoint Foundation 2013 \(KB3118368\)](#)

- Introduce a new switch to enable recall to be excluded from the link update group of search indexes that may contain unrelated content based on user queries.
- Makes query logging to use original user query text.
- Fixes the following issues:
 - When you edit a SharePoint page, screen readers report RTE fields as unlabeled edit.
 - When you insert embedded code and move to the delete button, screen readers report the button as a popup.
 - When the If-Modified-Since HTTP header instead of the If-None-Match HTTP header is sent, the server responds with the (304) Not Modified error even when the document is changed since the client-specified time.

- If you have an orphaned app in the initialized state on a site and you delete the site, Health Analyzer reports that there's an error and the auto-fix doesn't work.
- The [client context](#) builds incorrect urls if page context information isn't available yet.
- When you send email messages with multiple attachments that have a same attachment name, the email messages are deleted and aren't saved in SharePoint Server 2013 lists.
- If an alert with multiple user lookup fields is generated, some fields will have incorrect or missing data.
- A Content Query Web Part may display no result for a query that includes more than 10 lists if one of the lists has more than 5000 items with unique permissions.
- Links that are longer than 256 characters are truncated after a rename, a content type update, or a content deployment.
- As part of SharePoint database upgrade, the members of the db_owner role are deleted from the role, except for the "dbo" user and the user performing the upgrade. This is done for enhanced security to make sure that an errant account isn't inadvertently left with the db_owner role privileges. However, there may be situations where this behavior is not desirable. For example, RBS may be broken each time upgrade is run. In this situation, a registry key is added to bypass this behavior.

Note Before you install this update, follow the steps in the [Registry information](#) section to create the registry key.

- Links may begin with "//" (such as //www.microsoft.com/about/) as malformed server-relative links. After you install this update, the links are recognized as specifying the host name but keeping the same URL scheme as the referencing page.

MS16-121: Description of the security update for Word Automation Services on SharePoint Server 2013: October 11, 2016

This security update contains improvements and fixes for the following nonsecurity issues:

- When you use Word Automation Services to update fields, table-related formulas are reset to value zero.

October 11, 2016, update for SharePoint Foundation 2013 (KB3118371)

- Translates some terms in multiple languages to make sure that the meaning is accurate.

- Fixes the following issue:

As part of SharePoint database upgrade, the members of the db_owner role are deleted from the role, except for the "dbo" user and the user who runs the upgrade. This is done for enhanced security to make sure that an errant account isn't inadvertently left with the db_owner role permissions. However, there may be situations where this behavior isn't desirable. For example, RBS may be broken every time that an upgrade is run. In this situation, a registry key is added to bypass this behavior.

Note Before you install this update, follow the steps in the [Registry information](#) section to create the registry key.

October 11, 2016, update for SharePoint Server 2013 (KB3115166)

- Updates Norwegian_Nynorsk proofing tools.
- Fixes the following issue:

The **Options** dialog box appears after seconds of delay on a computer that has the Czech keyboard layout and proofing tools set.

October 11, 2016, update for Project Server 2013 (KB3118370)

Important notes about the cumulative update package

- The Microsoft Office 2013 hotfixes are now multilingual. This cumulative update package contains updates for all languages.
- This cumulative update package includes all the server component packages. Additionally, this cumulative update package updates only those components that are installed on the system.

October 11, 2016, update for SharePoint Server 2016 (KB3118372)

- **The patching and upgrade time is improved in the October 2016 public update to be 20% - 40% faster than the [September 2016 public update](#).** However, patching and upgrade will still take longer than previous public updates. Please be patient while patching and upgrading operations are completing.

This update includes the following improvements and fixes for SharePoint Server 2016:

- Translates some terms in multiple languages to make sure that the meaning is accurate.

- The update defaults the [Site.GetChanges](#) method to 1000 changes instead of 0 when you use client-side object model (CSOM).
- Fixes the following issues:
 - If you insert comments to a document in SharePoint Server 2016 that has Visio Services, the time in the comments is displayed incorrectly if you view it on the same day at least 2 hours later. For example, 2 hours ago is displayed as 2 minutes ago.
 - Assume that a SharePoint farm is configured so that team sites are on web application "A" and personal sites are on web application "B." When you try to view document libraries for a followed team site from the OneDrive for Business library through the Site Folders feature, you receive the following error message:

This site doesn't have any document libraries. If you want to have documents associated with this site, add a document library to it.

- When you update the background page, data-connected shapes on the background page aren't updated with the new data.
- After you switch views in an InfoPath form in Internet Explorer 11, the People Picker control displays the following error message:

JSON IS UNDEFINED
- When you check data through the decomposition tree on a PerformancePoint dashboard, a loading screen is displayed and never goes away.
- The title of .vsdx documents is erased or deleted during the approval workflow execution in SharePoint Server 2016.
- Even though there are some products and updates missing on a local server, PSConfig doesn't stop joining the server to a farm. Additionally, there's a .Net framework error when you join the server to a farm.
- Provides client-side object model (CSOM) API to obtain information for web applications and site collections.
- Intermittent failure when you mount and upgrade a content database from SharePoint Server 2013.
- The license upgrade time-out issue documented in the [September 2016 public update](#) is fixed. SharePoint Server 2016 license upgrade operations will no longer fail from timing out.

- User information is corrupted because of the timing issues with Windows SharePoint Services (WSS) synchronization and site migration.

October 11, 2016, update for SharePoint Server 2016 (KB3118376)

- Translates some terms in multiple languages to make sure that the meaning is accurate.
