September 11, 2018, update for SharePoint Foundation 2013 (KB4092478)

This update addresses some issues about the SharePoint Properties Panel in Microsoft Word 2013.

- For example, when a document is renamed or a document has required properties, you receive the following error message:

No SharePoint properties found.

- This update also addresses the encoding issue of the document URL.

September 11, 2018, update for Project Server 2013 (KB4092480)

Assume that you open a Project Web App by using the latest Microsoft Edge browser. You experience the following issues:

- After you create and apparently save a project in the Project Center, the project is not actually saved and no longer exists.
- If you change a custom field value in an existing project, the change is not saved.

Description of the security update for SharePoint Enterprise Server 2013: September 11, 2018

This security update contains improvements and fixes for the following nonsecurity issue:

- Assume that you set Managed Navigation for a subsite. When you navigate to a page on the subsite through the friendly URL of its term, the query variable {Page} or {Page.URL} returns an invalid URL for the page.

Description of the security update for SharePoint Enterprise Server 2016: September 11, 2018

This security update contains improvements and fixes for the following nonsecurity issues for SharePoint Server 2016:

- When you upload a document to a folder in a document library by using the Microsoft Edge browser, you can't select a destination folder.
- Assume that you set Managed Navigation for a subsite. When you navigate to a page on the subsite through the friendly URL of its term, the query variable {Page} or {Page.URL} returns an invalid URL for the page.
- If a document is followed by a user, and its name contains special characters, you can't open the document.

- This update addresses some issues about the SharePoint Properties Panel in Word 2016. For example, when a document is renamed or a document has required properties, you receive the following error message:

No SharePoint properties found.

This update also addresses the encoding issue of the document URL.

- When you right-click an Analytic Chart or Grid in a PerformancePoint dashboard page, and then you select **Filter > Top 10**, you may receive the following error message:

An unexpected error occurred.

- This update increases the maximum length of URLs to 4,000 characters for reporting databases.

This security update contains improvements and fixes for the following nonsecurity issues for Project Server 2016:

- You can't update the Status Manager field for a task through the Client-Side Object Model (CSOM).
- When you create and insert a new task into a collapsed task outline in a project through the Client-Side Object Model (CSOM), the new task may be inserted at the wrong location in the project.
- When you assign a resource to a task through the Client-Side Object Model (CSOM), this is done based on the resource name instead of pairing the resource and task GUID fields. As a result, the resource that is assigned to the task is not the one that is specified through CSOM.
- When the scheduled Backup and Restore Timer job runs, SQL Server deadlocks occur when an archived version of the project has to be deleted before a new version can be written.
- If a task link is created between two tasks, the dependency type of the task link can't be changed through the Client-Side Object Model (CSOM).
- The Task [IsLockedByManager](#) property can't be set through the Client-Side Object Model (CSOM).
- You can't get the department that is associated with a custom field through the Client-Side Object Model (CSOM).
- When you try to get an enterprise resource through the Client-Side Object Model (CSOM), the RES_ID property (the Unique ID of an enterprise resource), isn't returned in the same manner as it is through the Project Server Interface (PSI).

- You can't return a list of template projects by using the Client-Side Object Model (CSOM) ProjectCollection.
- You can't update a Lookup Table mask through the Client-Side Object Model (CSOM). Therefore, you can't programmatically add a value to the Lookup Table at the level that is not defined in the mask.
