MS15-110: Description of the security update for SharePoint Foundation 2013: October 13, 2015 (KB3085582)

This update contains fixes for the following non-security issues:

- REST query fails if a post contains an image without any associated text. For example, you can't access a newsfeed, and you receive the following error message when you send a REST query:

The server encountered an error processing the request. See server logs for more details.

- Welcome email is not sent to users when the user who creates the invitation is not the owner, and no message is entered in the optional message text box.
- When you create a document set, all entered data is lost if a field validation fails.
- After you select **Cancel** on the **Edit Properties** page of a publishing page, you are redirected to the document library but not the page.
- Incremental crawls on certain crawl sources cause sustained high CPU usage and gradually increasing memory consumption.
- The WOPI Discovery Synchronization timer job is displayed as successful even if it fails.
- When you drag-and-drop files to a SharePoint site, the upload process may freeze after a brief period of inactivity.

- When you restore or move a site collection to a different location, the URL of the site logo image isn't updated.
- Custom CSS styles aren't displayed for the RichHtmlField control on ribbons.
- After you migrate from SharePoint Server 2010 to SharePoint Server 2013, you can't access workflows of a list to start a new workflow or check the status of existing instances for SharePoint Server 2010 workflows.
- When you try to access a list for which you don't have access permissions, you expect to receive an access denied error message. Instead, you receive the following error message:

The "ListViewWebPart" Web Part appears to be causing a problem. Object reference not set to an instance of an object.

- After you restore or copy a site collection, the URL of the navigation node is invalid.
- After you use the Copy-SPSite cmdlet to synchronize a new created site collection, you can't use OneDrive for Business to synchronize an old site collection.

Note To resolve this issue, you also have to apply [September 16, 2014 update for OneDrive for Business \(KB2889931\)](#).

- Fixes the following issues in Azure plugin in hybrid crawler:
 - Sends headers with additional information to secure cloud services (SCS).
 - Fixes Azure plugin freezes because of status change (pause or resume).
 - Fixes the spoindextypename value.
- You cannot attach any files to list items in a SharePoint Server 2013 site. The operation fails, and you receive with a message that states that the path contains invalid characters.

MS15-110: Description of the security update for SharePoint Server 2013: October 13, 2015 (KB3085567)

This update contains fixes for the following nonsecurity issues:

- When you create a SharePoint site by using a saved template that has a site feed Web Part, you experience the following issues:
- Post to the site feed Web Part isn't displayed in the search result.
- If you search for text in the posts, the results are not displayed as conversations.
- If a post has hash tags, the tags never are counted in trending tags, and the post is not displayed on the hash-tag profile page.
- When you create a site that is based on a site template that has the Community Site feature enabled, you can't see communities, and you receive the following error message:

Cannot complete this action. Please try again.

This update disables the option to **Save site as a template** for a site that has the Community Site feature enabled.

- If a document set has a shared field of the SharePoint integer type, the value of the field isn't propagated to documents inside the document set.
- When you receive a message about a discussion list, the author of the post isn't displayed.
- Invalid XML in CMIS fields doesn't ignore browser processing as expected.
- Site-deleting notification displays an incorrect date if the site regional setting locale isn't set to en-us.
- When you create a document set, all entered data is lost if a field validation fails.
- If an app that has a feature is used on a source label, new variation labels can't be created because the variation to create a hierarchies job fails.
- Incremental crawls on certain crawl sources cause sustained high CPU usage and gradually increasing memory consumption.

- When you use managed metadata navigation and filtering, the halo around the active item on the menu is truncated, and the separator of the navigation bar is displayed with an inconsistent width.
- Created and changed dates are displayed incorrectly for documents in a document set that are moved to the Drop Off library of a Records Center site.
- When you try to create a page by using a name that contains a space, you receive an error message that states that the special characters aren't allowed.
- Lync and Skype of Business presence doesn't work on the "people search" results page in the SharePoint Server 2013 search center.
- Product names such as Word and Excel are translated in the search result page of the search center in Finnish language.
- Fixes the following issues in Azure plugin in the hybrid crawler:
 - Sends headers with additional information to secure cloud services (SCS).
 - Fixes Azure plugin freezes because of status change (pause or resume).
 - Fixes the spoindextypename value.
 - The exception in UrlMapper.RefreshCache may cause the w3wp.exe process to crash. You can't access the site, and data loss occurs.
- You can't use the [ManagedProperty.Update](#) method to update the [UseAAMMapping](#) property.
- You can't access a document by using a DocID URL on mobile devices. For example, a DocID URL resembles the following:

https://contoso.com/_layouts/15/DocIdRedir.aspx?ID=xxxx

October 13, 2015, update for SharePoint Server 2013 (KB3054945)

Fixes the following issue:

- Assume that you're filling out an InfoPath form in Microsoft Internet Explorer 11. The form contains a people picker control and a file attachment control and is located in a site collection in SharePoint 2010 mode. When you try to upload a file to the file attachment control, you receive the following error message:

An unexpected error has occurred.

October 13, 2015, update for Project Server 2013 (KB3085586)

Fixes the following issues:

- After status updates are accepted and applied to tasks in a project, the total actual work on the assignments may become larger, and the new actual work appears in time periods where the user didn't report it. For example, you report 8h on Monday and 3h on Tuesday. When you view the assignment in the project after the update is applied, besides the 8h on Monday and 3h on Tuesday, you may also see 8h on Thursday and Friday.
- You can use the keyboard shortcut (Ctrl + Delete) to delete tasks from a timesheet even though the actual work is submitted or saved.
- When you select the Publish button while editing a project in Project Web App, the project stays in a "saving" state. This issue occurs if there're no changes to save within the project.
- You can change your own timesheet data after you submit it if you have the Adjust Timesheet permission.
- The queue service may consume all server memory over time and eventually crashes. This issue occurs if you have Project Server notifications and reminders enabled.
- Assume that you create a task and then submit it for approval. However, the submission is rejected. In this situation, the task remains on the timesheet, and you can't submit the timesheet because the rejected task is still on it.
